1 INTRODUCTION

The Marine Biological Laboratory (MBL) uses lasers and laser systems which are

integral part of the academic and research environment. Lasers are extraordinary research tools that enable scientists to perform novel experiments and explore innovative applications that may lead to pioneering scientific discovery.

The LASER (Light Amplification by Stimulated Emission of Radiation) produces an intense

2 LASER SAFETY PROGRAM ORGANIZATION

The Laser Safety Program organization at the MDI consists of the Radiation Safety

Committee (RSC), LSO, Principal Investigators or Course Directors (Authorized Laser Users) and Laser Operators (Users). The RSC is responsible for ensuring compliance

with all applicable federal, state and local laws and regulations involving both ionizing

3.2 Laser Safety Officer

The specific duties and responsibilities of the LSO include:

Develop and coordinate implementation of the Laser Safety Program

[Redacted]

[Redacted]

Monitor and enforce laser safety procedures

[Redacted]

[Redacted]

- Develop and submit to the LSO for approval the current Standard Operating Procedures (SOPs) for each Class 3B and Class 4 laser or laser system using the **LASER SOP (APPENDIX D)** as a guide.
- Identify laser hazards present in the work area, implement appropriate hazard controls (e.g., ANSI-approved signs and labels), and correct any identified unsafe conditions (**APPENDIX E** and **APPENDIX F**).

- Identify all authorized personnel who are permitted to operate or maintain a laser system and ensure that laser users have attended the Laser Safety Training provided by the LSO prior to operating a Class 3B or Class 4 laser or laser system.

LSO prior to operating a Class 3B or Class 4 laser or laser system.

- Provide required protective measures for laser radiation control (e.g., laser protective eyewear, barriers, curtains, etc.).

-
-
- Notify the LSO in the event of an exposure incident.
-

3.4 Laser Users

Know the hazards, safety procedures, and control measures for laser use in the work area.

Contact the I SO to discuss laser decommissioning plans

- Remove all means of activating the laser or laser system (electrically deactivated), or destroy the laser hardware (rendered inoperable).
- Review the manufacturer's laser manual for "**CAUTION!**" statements that list hazardous materials.
- Remove and properly dispose of all hazardous materials (e.g., mercury switches, ~~h~~ ~~etterics~~ ~~oil~~ ~~dyes~~ ~~beryllium oxide~~) or other chemicals that are contained in the

laser system.

- Properly dispose of any chemical, biological, or radioactive wastes generated from the laser activities.

4.5 Laser Hazard Evaluation

Class 2B and Class 4 laser management plans based on the I SO's laser manual

[REDACTED]

exposure likelihood etc.).

5 LASER USER TRAINING AND REGISTRATION

The PI/Laboratory Supervisor is responsible for ensuring that faculty, staff, and students receive appropriate training on the laser hazards in their work area and that a record of the training is kept. Laser users must be re-trained whenever new hazard is

[REDACTED]

- Beam and Non-Beam Hazards.
- Turning ON/OFF the laser device.
- Emergency stop or deactivation procedure.
- Alignment protocols.

requirements of the FLPPS. Removal of protective housing or system modification can increase a laser's classification. Contact the LSO for review prior to servicing or system modification.

Lasers and laser systems that are fabricated in-house and are used by the individual(s) who designed and constructed the device are not subject to the requirements of the FLPPS.

They must be classified according to the recommendations of the ANSI Z136.1-2014 Standard to ensure appropriate control measures are implemented.

6.1 Class 1 Laser System

Considered incapable of producing exposure conditions during normal operation

unless the beam is viewed with an optical instrument such as a telescope.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions.

2. It also highlights the need for regular audits to ensure the integrity of the financial data.

3. Furthermore, the document emphasizes the role of transparency in building trust with stakeholders.

4. In addition, it outlines the various methods used to collect and analyze financial information.

5. Finally, the document concludes by stressing the importance of ongoing communication and reporting.

Financial Statement Analysis

6. This section provides a detailed overview of the different types of financial statements used in business.

7. It also discusses the various ratios and metrics used to evaluate a company's financial performance.

8. Furthermore, the document explains how these metrics can be used to identify trends and opportunities.

9. In addition, it outlines the steps involved in conducting a thorough financial statement analysis.

10. Finally, the document concludes by emphasizing the importance of using this information to make informed decisions.

11. The next section discusses the various factors that can influence a company's financial performance.

12. It also outlines the different strategies used to manage these risks and opportunities.

13. Furthermore, the document explains how these strategies can be used to improve a company's financial health.

14. In addition, it outlines the various methods used to monitor and evaluate the effectiveness of these strategies.

15. Finally, the document concludes by stressing the importance of ongoing monitoring and reporting.

16. The following section discusses the various methods used to collect and analyze financial data.

17. It also outlines the different types of data used in financial analysis and how they are collected.

18. Furthermore, the document explains how this data can be used to identify trends and opportunities.

19. In addition, it outlines the steps involved in conducting a thorough financial data analysis.

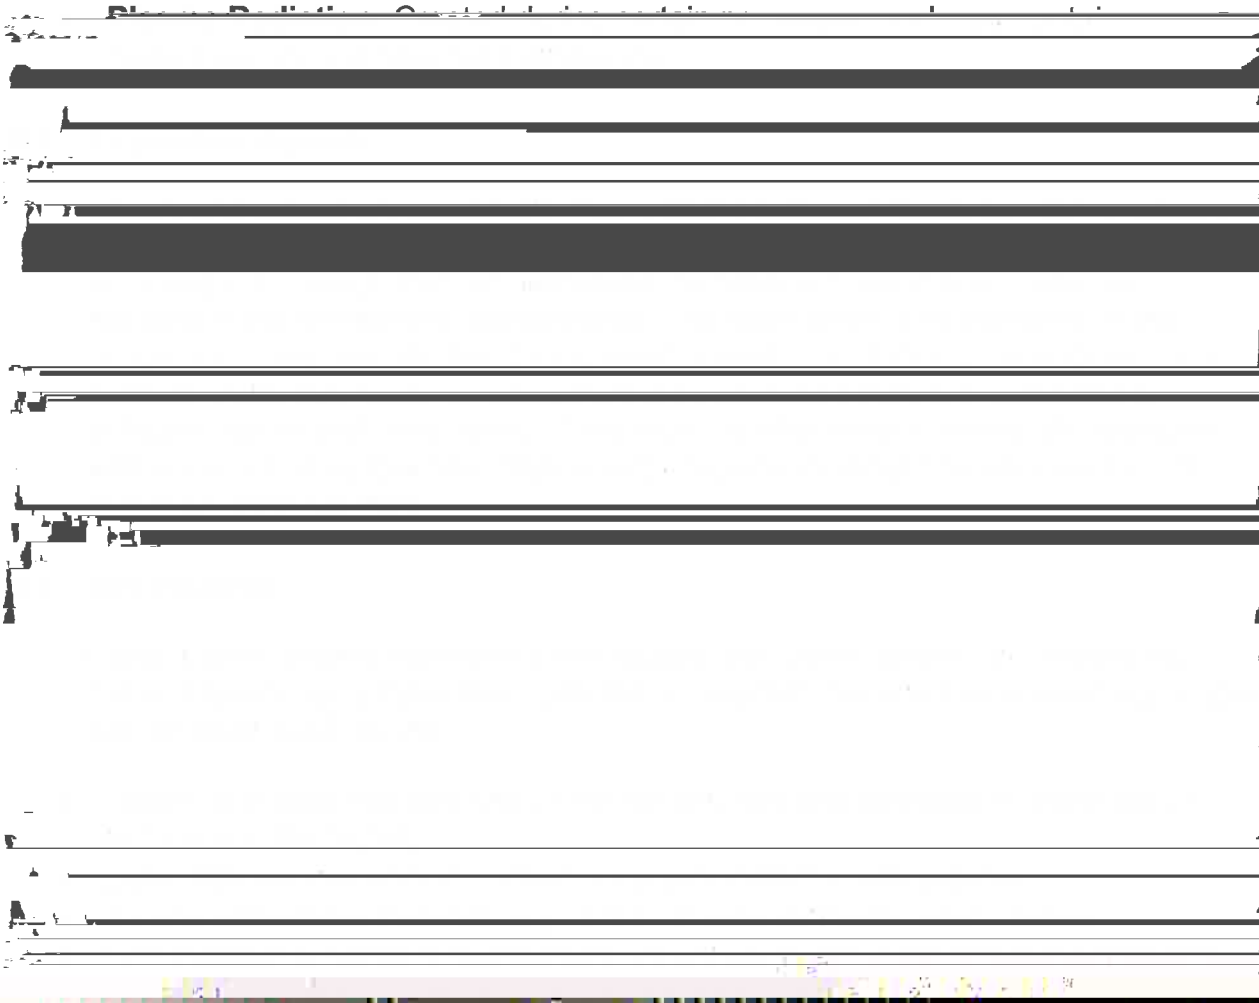

20. Finally, the document concludes by emphasizing the importance of using this information to make informed decisions.

21. The next section discusses the various factors that can influence a company's financial performance.

22. It also outlines the different strategies used to manage these risks and opportunities.

23. Furthermore, the document explains how these strategies can be used to improve a company's financial health.

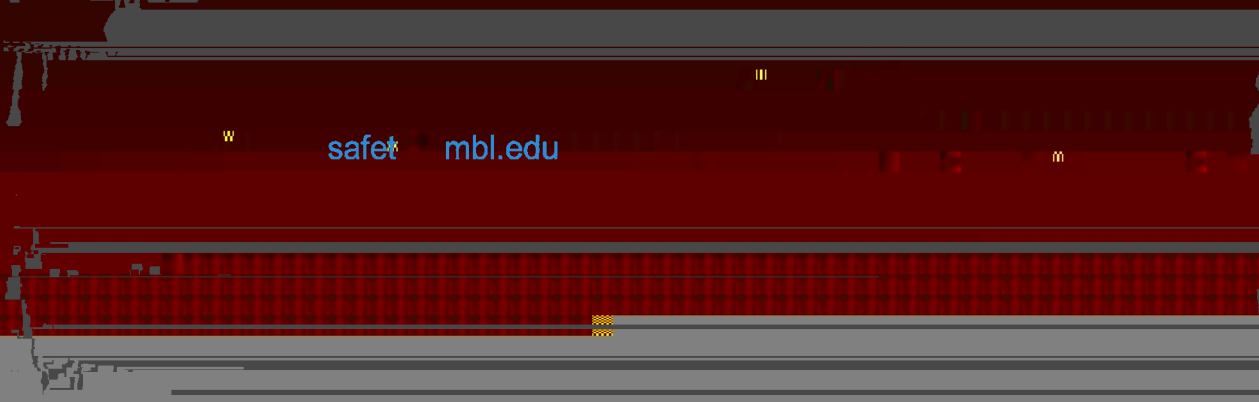

UV-A accelerates this process and may lead to presbyopia (the loss of the

hazardous UV and blue light emissions.

8.4 Explosion Hazards

Lasers and subsidiary equipment may present explosion hazards. High-pressure

safety mbl.edu

tone of voice at a distance of about three feet, several times exceeding
normal human hearing range. The hearing loss has several times

choice. Administrative controls should be used whenever engineering controls are

neither feasible nor appropriate.

Principal Investigators using lasers shall provide and maintain the appropriate control

3. Labeling of Laser Protective Barriers

All laser protective barriers must be labeled with the barrier threshold limit and

exposure time for which the limit applies, and beam exposure conditions under which protection is afforded.

9.3 Engineering Controls

The engineering control measures required for Class 2B and Class 4 lasers are

+

9.4 Administrative and Procedural Controls

1. Standard Operating Procedures

The PI should develop written SOPs for Class 2B and Class 4 labs and have

The PI/Laboratory Supervisor must identify authorized personnel who are authorized to operate equipment in Class 2B or Class 4 labs and have

cause instant power failure. Users must take all possible precautions to avoid

and prevent direct beam exposures.

9.7 Skin Protection

The potential for skin injury from the use of high power lasers can present a

Must be under the direct supervision of an individual knowledgeable in laser

Must have all windows, doorways, open portals, etc. either covered or restricted

Must have appropriate personal protective equipment readily available (i.e. eye

safety.

All areas near the laser safety controls must be designed to allow rapid exit by laser

Personnel trained on entry/exit procedures and adequate personal protection.

11 SPECIAL CONSIDERATIONS

11.1 Operation of Enclosed Class 3B or Class 4 Lasers

safety@mbi.edu

Access to Class 3B or Class 4 lasers or laser systems enclosed within a protective housing or protected area enclosure is limited to properly trained individuals and

by specific engineering and administrative controls. Contact the LSO for more information (x7645 or)

11.2 Laser Alignment Guidelines

- Exclude unnecessary personnel from the laser area during alignment.
- Use low-power visible lasers for path simulation of higher power visible or invisible lasers whenever possible.
- Wear laser protective eyewear during alignment. Use special alignment eyewear when circumstances (e.g. wavelength, power, etc.) permit their use.
- When aligning invisible (e.g. UV, IR) beams, use beam display devices such as image converter viewers or phosphor cards to locate beams.

12 MEDICAL EVALUATIONS

Baseline and termination eye examinations are optional for Class 3B and Class 4 laser use, based on ANSI Z136.1-2014 recommendations. Eye examinations are required for

[Redacted content]

safety@mbi.edu

[Redacted content]

- In case of exposure or suspected exposure to laser radiation, seek immediate medical attention.
- In the event of fire or life-threatening injuries, call 911 or MBL Campus Security (7-911).

Inform the D/L laboratory Supervisor promptly following the incident, and

safety@mbi.edu

APPENDIX I
GLOSSARY OF TERMS

Absorption: Transformation of radiant energy to a different form of energy by interaction with matter.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Accessible Emission Limit (AEL): The maximum accessible emission level permitted within a particular laser hazard class.

Beam spread: The angle at which the laser beam spreads in the far field; the bending of

rays away from each other, as by a concave lens or convex mirror; measured in milliradians (mrad). Sometimes this is also referred to as beam spread.

Duty factor: The product of the pulse duration and the pulse repetition rate.

irradiance (E): The power emitted per unit area upon a surface, expressed in watts per

square meter (W m^{-2}). It is a scalar quantity, representing the total power incident on a surface per unit area. It is related to the radiance (L) by the equation $E = \pi L$, where π is the solid angle subtended by a hemisphere.

The radiance (L) is a vector quantity, representing the power emitted per unit area per unit solid angle. It is related to the irradiance (E) by the equation $L = E / \pi$. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium. The radiance is a function of direction, and it is used to describe the distribution of radiation in a medium.

Power: The rate at which energy is emitted, transferred, or received. Unit: watts (Joules per second).

Protective housing: An enclosure that surrounds the laser or laser system and

prevents access to laser radiation above the applicable MPE. The aperture through which the useful beam is emitted is not part of the protective housing. The protective housing limits access to other associated radiant energy emissions and to electrical

and a workstation.

Specular reflection: A mirror-like reflection.

Transmittance: The ratio of total transmitted radiant energy to the incident radiant energy, or the fraction of light that passes through a medium.

Ultraviolet (UV) Radiation (light): Electromagnetic radiation with wavelengths smaller than those of visible radiation; for the purpose of laser safety, 100nm to 400nm
